

Solarinet Monitoring

"Client"

"Remote Monitor"

"Server"

- Inspects, catalogues, and reports system attributes:

- hostname
- hardware
- Free disk space
- OS
- Network addresses
- architecture (armv7, x86_64, PPC, etc.)
- Performance:
 - CPU load
 - RAM usage
 - swapfile usage
 - network traffic vs. capacity
 - USB traffic vs. capacity
 - etc.

- Monitor local performance of key software, such as:

- processes running
- process open files (incl. network sockets)
- monitoring log files

- Connects to TCP/UDP/ICMP sockets of monitor apps remotely (elsewhere on the intranet)

- Inspects for service failure, slowdown, and other real time performance metrics, as well as service version, vendor, config, and more ("stationery") service metadata

- Monitors peer-to-peer and network-wide performance like latency, transit time, dropped packets, bandwidth vs. capacity, throughput, connection speed, overhead, and other link characteristics

- Collects client + monitor data

• Loads DB

- Generates dashboard
- Publishes regular reports

- Manages config, deployment, etc. of all nodes

Volume:

One per system
plus
one watchdog

Volume:

~10 at
various points

Volume:

One primary,
one failover
